ENLP Lecture 21b
Word & Document Representations; Distributional Similarity

Nathan Schneider

(some slides by Marine Carpuat, Sharon Goldwater, Dan Jurafsky)

28 November 2016
Topics

- Similarity
- Thesauri & their limitations
- Distributional hypothesis
- Clustering (Brown clusters, LDA)
- Vector representations (count-based, dimensionality reduction, embeddings)
Word & Document Similarity
Question Answering

• Q: What is a good way to remove wine stains?

• A1: Salt is a great way to eliminate wine stains

• A2: How to get rid of wine stains…

• A3: How to get red wine out of clothes…

• A4: Oxalic acid is infallible in removing iron-rust and ink stains.
Document Similarity

• Given a movie script, recommend similar movies.

ALAN TURING (V.O.)
Are you paying attention?

INT. ALAN TURING’S HOUSE - DAY - 1951

A HALF-DOZEN POLICE OFFICERS swarm the Manchester home of mathematics professor Alan Turing.

ALAN TURING (V.O.)
Good. This is going to go very quickly now. If you are not listening carefully, you will miss things. Important things. You’re writing some of this down? That’s good.

BERTIE
Like mad King George the Third, there’ll be King George the stammerer, who let his people down so badly in their hour of need!

Lionel sits down on the chair of Edward the Confessor. Leaning against it is the great two-handed sword of St. George.

BERTIE
What’re you doing? Get up! You can’t sit there!

LIONEL
Why not? It’s a chair.
Word Similarity
Intuition of Semantic Similarity

Semantically close
- bank–money
- apple–fruit
- tree–forest
- bank–river
- pen–paper
- run–walk
- mistake–error
- car–wheel

Semantically distant
- doctor–beer
- painting–January
- money–river
- apple–penguin
- nurse–fruit
- pen–river
- clown–tramway
- car–algebra
Why are 2 words similar?

• Meaning
  – The two concepts are close in terms of their meaning

• World knowledge
  – The two concepts have similar properties, often occur together, or occur in similar contexts

• Psychology
  – We often think of the two concepts together
Two Types of Relations

• Synonymy: two words are (roughly) interchangeable

• Semantic similarity (distance): somehow “related”
  – Sometimes, explicit lexical semantic relationship, often, not
Validity of Semantic Similarity

• Is semantic distance a valid linguistic phenomenon?
• Experiment (Rubenstein and Goodenough, 1965)
  – Compiled a list of word pairs
  – Subjects asked to judge semantic distance (from 0 to 4) for each of the word pairs
• Results:
  – Rank correlation between subjects is ~0.9
  – People are consistent!
Why do this?

• Task: automatically compute semantic similarity between words

• Can be useful for many applications:
  – Detecting paraphrases (i.e., automatic essay grading, plagiarism detection)
  – Information retrieval
  – Machine translation

• Why? Because similarity gives us a way to generalize beyond word identities
Evaluation: Correlation with Humans

• Ask automatic method to rank word pairs in order of semantic distance
• Compare this ranking with human-created ranking
• Measure correlation
Evaluation: Word-Choice Problems

Identify that alternative which is closest in meaning to the target:

accidental
wheedle
ferment
inadvertent
abominate

imprison
incarcerate
writhe
meander
inhibit
Evaluation: Malapropisms

*Jack withdrew money from the ATM next to the *band.*

*band* is unrelated to all of the other words in its context...
Word Similarity: Two Approaches

• Thesaurus-based
  – We’ve invested in all these resources... let’s exploit them!

• Distributional
  – Count words in context
Thesaurus-based Similarity

- Use the structure of a resource like WordNet
- Examine the relationship between the two concepts, use a metric that converts the relationship into a real number
- E.g., path length: \( \text{sim}(c_1, c_2) = -\log |\text{path}(c_1, c_2)| \)
- How would you deal with ambiguous words?
Thesaurus Methods: Limitations

- Measure is only as good as the resource
- Limited in scope
  - Assumes IS-A relations
  - Works mostly for nouns
- Role of context not accounted for
- Not easily domain-adaptable
- Resources not available in many languages
Distributional Similarity

“Differences of meaning correlates with differences of distribution” (Harris, 1970)

• Idea: similar linguistic objects have similar **contents** (for documents, sentences) or **contexts** (for words)
Two Kinds of Distributional Contexts

1. Documents as bags-of-words
   - Similar documents contain similar words; similar words appear in similar documents

2. Words in terms of neighboring words
   - “You shall know a word by the company it keeps!” (Firth, 1957)
   - Similar words occur near similar sets of other words (e.g., in a 5-word window)
He handed her a glass of **bardiwac**.

**Beef dishes** are made to complement the **bardiwac**.

Nigel staggered to his feet, face flushed from too much **bardiwac**.

**Malbec**, one of the lesser-known **bardiwac** grapes, responds well to Australia’s sunshine.

I dined off bread and cheese and this excellent **bardiwac**.

The drinks were delicious: blood-red **bardiwac** as well as light, sweet Rhenish.
Word Vectors

• A word type can be represented as a vector of features indicating the contexts in which it occurs in a corpus

\[ \vec{w} = (f_1, f_2, f_3, \ldots f_N) \]
Context Features

- **Word co-occurrence within a window:**

<table>
<thead>
<tr>
<th></th>
<th>arts</th>
<th>boil</th>
<th>data</th>
<th>function</th>
<th>large</th>
<th>sugar</th>
<th>summarized</th>
<th>water</th>
</tr>
</thead>
<tbody>
<tr>
<td>apricot</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>pineapple</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>digital</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>information</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

- **Grammatical relations:**

<table>
<thead>
<tr>
<th></th>
<th>subj-of, absorb</th>
<th>subj-of, adapt</th>
<th>subj-of, behave</th>
<th>pobj-of, inside</th>
<th>pobj-of, into</th>
<th>nmod-of, abnormality</th>
<th>nmod-of, anemia</th>
<th>nmod-of, architecture</th>
<th>obj-of, attack</th>
<th>obj-of, call</th>
<th>obj-of, come from</th>
<th>obj-of, decorate</th>
<th>nmod, bacteria</th>
<th>nmod, body</th>
<th>nmod, bone marrow</th>
<th>nmod, bone marrow</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>16</td>
<td>30</td>
<td>3</td>
<td>8</td>
<td>1</td>
<td>6</td>
<td>11</td>
<td>3</td>
<td>2</td>
<td>3</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>
Context Features

• Feature values
  – Boolean
  – Raw counts
  – Some other weighting scheme (e.g., \textit{idf}, \textit{tf.idf})
  – Association values (next slide)
Association Metric

- Commonly-used metric: Pointwise Mutual Information

\[ \text{association}_{\text{PMI}}(w, f) = \log_2 \frac{P(w, f)}{P(w)P(f)} \]

- Can be used as a feature value or by itself
Computing Similarity

• Semantic similarity boils down to computing some measure on context vectors
Words in a Vector Space

• In 2 dimensions:
  \( \mathbf{v} = \text{“cat”} \)
  \( \mathbf{w} = \text{“computer”} \)

\[ \mathbf{v} = (v_1, v_2) \]
\[ \mathbf{w} = (w_1, w_2) \]
Euclidean Distance

- $\sqrt{\sum_i (v_i - w_i)^2}$
- Can be oversensitive to extreme values
Cosine Similarity

- Cosine distance: borrowed from information retrieval

\[
\text{sim}_{\text{cosine}}(\vec{v}, \vec{w}) = \frac{\vec{v} \cdot \vec{w}}{|\vec{v}| |\vec{w}|} = \frac{\sum_{i=1}^{N} v_i \times w_i}{\sqrt{\sum_{i=1}^{N} v_i^2} \sqrt{\sum_{i=1}^{N} w_i^2}}
\]
Distributional Approaches: Discussion

- No thesauri needed: data driven
- Can be applied to any pair of words
- Can be adapted to different domains
Distributional Profiles: Example

**DP of star**

- space 0.21
- movie 0.16
- famous 0.15
- light 0.12
- rich 0.11
- heat 0.08
- planet 0.07
- hydrogen 0.07

**DP of fusion**

- heat 0.16
- hydrogen 0.16
- energy 0.13
- hot 0.09
- light 0.09
- space 0.04
- gravity 0.03
- pressure 0.03
Distributional Profiles: Example

DP of *star*

- space 0.21
- movie 0.16
- famous 0.15
- light 0.12
- rich 0.11
- heat 0.08
- planet 0.07
- hydrogen 0.07

DP of *fusion*

- heat 0.16
- hydrogen 0.16
- energy 0.13
- hot 0.09
- light 0.09
- space 0.04
- gravity 0.03
- pressure 0.03
Problem?

DP of *star*

- space 0.21
- movie 0.16
- famous 0.15
- light 0.12
- rich 0.11
- heat 0.08
- planet 0.07
- hydrogen 0.07

DP of *fusion*

- heat 0.16
- hydrogen 0.16
- energy 0.13
- hot 0.09
- light 0.09
- space 0.04
- gravity 0.03
- pressure 0.03
Distributional Profiles of Concepts

DP of **CELESTIAL BODY**
*(celestial body, star, sun, ...)*

- space 0.36
- light 0.27
- heat 0.11
- planet 0.07
- hydrogen 0.06
- hot 0.01

DP of **CELEBRITY**
*(celebrity, hero, star, ...)*

- famous 0.24
- movie 0.14
- rich 0.14
- fan 0.10
- hot 0.04
- fashion 0.01
Semantic Similarity: “Celebrity”

DP of CELEBRITY
(celebrity, hero, star,...)
famous 0.24
movie 0.14
rich 0.14
fan 0.10
hot 0.04
fashion 0.01

DP of FUSION
(atomic reaction, fusion, thermonuclear reaction,...)
heat 0.16
hydrogen 0.16
energy 0.13
hot 0.09
light 0.09
space 0.04

Semantically distant...
Semantic Similarity: “Celestial body”

<table>
<thead>
<tr>
<th>DP of CELESTIAL BODY</th>
<th>DP of FUSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>(celestial body, star, sun...)</td>
<td>(atomic reaction, fusion, thermonuclear reaction,...)</td>
</tr>
</tbody>
</table>

- Space 0.36
- Light 0.27
- Heat 0.11
- Planet 0.07
- Hydrogen 0.07
- Hot 0.07

- Heat 0.16
- Hydrogen 0.16
- Energy 0.13
- Hot 0.09
- Light 0.09
- Space 0.04

Semantically close!
Word Clusters

• E.g., Brown clustering algorithm produces hierarchical clusters based on word context vectors

• Words in similar parts of hierarchy occur in similar contexts

Chairman is 0010, “months” = 01, and verbs = 1

Brown clusters created from Twitter data: http://www.cs.cmu.edu/~ark/TweetNLP/cluster_viewer.html
Document-Word Models

• Features in the word vector can be word context counts or PMI scores

• Also, features can be the documents in which this word occurs
  
  ▶ Document occurrence features useful for **topical/thematic** similarity
Topic Models

- Latent Dirichlet Allocation (LDA) and variants are known as **topic models**
  - Learned on a large document collection (unsupervised)
  - Latent probabilistic **clustering** of words that tend to occur in the same document. Each **topic** cluster is a distribution over words.
  - Generative model: Each document is a sparse mixture of topics. Each word in the document is chosen by sampling a topic from the document-specific topic distribution, then sampling a word from that topic.
  - Learn with EM or other techniques (e.g., Gibbs sampling)
Topic Models

DIMENSIONALITY REDUCTION

Slides based on presentation by Christopher Potts
Why dimensionality reduction?

• So far, we’ve defined word representations as rows in $F$, a $m \times n$ matrix
  – $m =$ vocab size
  – $n =$ number of context dimensions / features

• Problems: $n$ is very large, $F$ is very sparse

• Solution: find a low rank approximation of $F$
  – Matrix of size $m \times d$ where $d << n$
Methods

• Latent Semantic Analysis
• Also:
  – Principal component analysis
  – Probabilistic LSA
  – Latent Dirichlet Allocation
  – Word2vec
  – ...

43
Latent Semantic Analysis

• Based on **Singular Value Decomposition**

For any matrix of real numbers $A$ of dimension $(m \times n)$ there exists a factorization into matrices $T$, $S$, $D$ such that

$$A_{m\times n} = T_{m\times m} S_{m\times m} D_{n\times m}^T$$

$$
\begin{pmatrix}
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\end{pmatrix} =
\begin{pmatrix}
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\end{pmatrix} 
\begin{pmatrix}
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots \\
\end{pmatrix}^T
$$

$$A_{3\times 4} = T_{3\times 3} S_{3\times 3} D_{4\times 3}^T$$
LSA illustrated:

Word embeddings based on neural language models

• So far: Distributional vector representations constructed based on **counts** (+ dimensionality reduction)

• Recent finding: Neural networks trained to **predict neighboring words** (i.e., language models) learn useful low-dimensional word vectors
  
  ▸ Dimensionality reduction is built into the NN learning objective

  ▸ Once the neural LM is trained on massive data, the word embeddings can be reused for other tasks
Word vectors as a byproduct of language modeling

A neural probabilistic Language Model. Bengio et al. JMLR 2003
Language modeling task: context of $w_t$ is $w_{t-1}, w_{t-2}, \ldots, w_{t-n+1}$

$$P(w_t = i \mid context) = \frac{\exp(\hat{C}(i) \cdot h)}{\sum_{j=1}^{V} \exp(\hat{C}(j) \cdot h)}$$

*i-th output* $= P(w_t = i \mid context)$

$h(context)$

Maybe more than one hidden layer

Word representations (aka embeddings)

Using neural word representations in NLP

• word representations from neural LMs
  – aka distributed word representations
  – aka word embeddings

• How would you use these word vectors?
• Turian et al. [2010]
  – word representations as features consistently improve performance of
    • Named-Entity Recognition
    • Text chunking tasks
Word2vec [Mikolov et al. 2013] introduces simpler models

[Diagram showing CBOW and Skip-gram models]

https://code.google.com/p/word2vec/
Word2vec claims

Useful representations for NLP applications

Can discover relations between words using vector arithmetic

\[ \text{king} - \text{male} + \text{female} = \text{queen} \]

Paper+tool received lots of attention even outside the NLP research community

try it out at “word2vec playground”: http://deeplearner.fz-qqq.net/51
Summary

• Given a large corpus, the meanings of words can be approximated in terms of words occurring nearby: **distributional context**. Each word represented as a **vector** of integer or real values.
  
  ‣ Different ways to choose context, e.g. context windows
  
  ‣ Different ways to count cooccurrence, e.g. (positive) **PMI**
  
  ‣ Vectors can be **sparse** (1 dimension for every context) or **dense** (reduced dimensionality, e.g. with **Brown clustering** or **LSA**)

• This facilities measuring **similarity** between words—useful for many NLP tasks!
  
  ‣ Different similarity measures, e.g. **cosine** (= normalized dot product)
  
  ‣ Evaluations: human relatedness judgments; extrinsic tasks
