

What is Linguistics?

Nathan Schneider
ANLP | 11 September 2017

What is language?

What is language?

- Wikipedia: “Language is the ability to acquire and use complex systems of communication, particularly the human ability to do so, and a language is any specific example of such a system. The scientific study of language is called linguistics.”

What is language?

- Dictionary.com: “1. a body of words and the systems for their use common to a people who are of the same community or nation, the same geographical area, or the same cultural tradition

“2. communication by voice in the distinctively human manner, using arbitrary sounds in conventional ways with conventional meanings; speech.”

What is language?

- Collins: “1. a system for the expression of thoughts, feelings, etc, by the use of spoken sounds or conventional symbols

“2. the faculty for the use of such systems, which is a distinguishing characteristic of man as compared with other animals”

What is language?

- Merriam-Webster: “**a:** the words, their pronunciation, and the methods of combining them used and understood by a community

“**b (1):** audible, articulate, meaningful sound as produced by the action of the vocal organs
 (2): a systematic means of communicating ideas or feelings by the use of conventionalized signs, sounds, gestures, or marks having understood meanings”

Knowledge of/about language

- Every linguist gets questions like:
 - * *“How many languages do you speak?”*
 - * *“Which is correct in this sentence: ‘who’ or ‘whom’?”*
- These reflect misunderstandings of what linguistics is.

Knowledge of/about language

- Studying a language does not necessarily require fluency in it
 - Though it requires data, ideally from a native speaker
- Speaking a language doesn't entail understanding how it works!
 - Linguistics = studying **what speakers know, but don't know they know**. Uncovering the **implicit** knowledge behind a skill.
 - You learned your native language primarily through exposure, not being taught the rules of grammar!

Knowledge of/about language

- **Speech** is primary, **writing** is a technology
 - Most languages of the world are never or rarely written down
 - Written language can be more conservative, stylistically fixed
- Mosts linguists are **descriptivists**
 - They study what language *is* according to the practice of a speech community, not what it *should be* according to some socially accepted authority or stereotype (**prescriptivist**).
 - In linguistics, **grammar rules** describe the patterns of how people talk.

Knowledge of/about language

- Forms of evidence
 - “Thought data”/native speaker intuitions
 - * *This test allows to determine whether the result is statistically significant.*
 - * *Who cares about how it looks like when it tastes damn good?*
 - Use data (corpora)
 - Lab data

Sentences + glosses

- (8) a. *Kto-to* (/ **kto-nibud*’) *postučal v dver’*.
“Someone (/ *anyone) knocked at the door.”
b. *Ešli čto-nibud’ slučitsja, ja pridu srazu*.
“If anything happens, I’ll come immediately.”

Wolof (Niger-Congo; Northern Atlantic) [Mark 1:29]

- (1) ...*génn* *na-ñu* *ci* *jàngu* *bi,* *ñu...* *dem*
...exit PERF-3SG PP.PROX church the, 3PL go

ci *kër* *Simon* *ak* *Andare*.
PP.PROX house Simon and Andrew

‘...when they were come **out of** the synagogue, they entered **into** the house of Simon and Andrew.’

Some language myths

- Kids today are ruining the previously pure form of our language.
 - Commentary of this nature goes back over the centuries. In fact, language is constantly evolving. It is an organic system, which means it complex and “messy” but adapts to the needs of speakers.

Some language myths

- When <low-prestige group members> talk they are being lazy/using bad grammar.
 - Relative to Standard American English, dialects like African-American English have some differences in **vocabulary** and **grammar** (including pronunciation and syntax).
 - Scientifically, is nothing better or worse about any dialect; there is just social prestige and acceptance.

Some language myths

- It's easy to define the boundaries of a language.
 - Roughly speaking, if two dialects are **mutually intelligible**, they are said to be from the same language. In practice, there can be a lot of gray area—e.g., Arabic has many dialects, some of which are quite different from each other.
 - **Geopolitical considerations** often interfere as well: colloquially we call Chinese a language, but Mandarin and Cantonese are not mutually intelligible. Conversely, by linguistic criteria, Hindi and Urdu are considered dialects of the same language.

Some language myths

- Sign language is less systematic than spoken language.
 - There are actually many sign languages: **American Sign Language** and **British Sign Language** are quite different, for example. This is because all languages develop subject to a community of speakers.
 - Sign languages also have grammar, with patterns and structure in how hands are shaped, how they are positioned and moved, facial expressions, etc.

Some language myths

- People are hereditarily predisposed to have an easier time learning some languages.
 - Fact: Children are capable of natively acquiring any language given sufficient exposure at the right age. Inability to do so is attributed to a mental or communicative deficit or disability.

Some language myths

- Most languages have millions of speakers.
 - Fact: There are approximately 6000–7000 languages spoken today. About **a third** have small native speaker populations and are in danger of extinction.

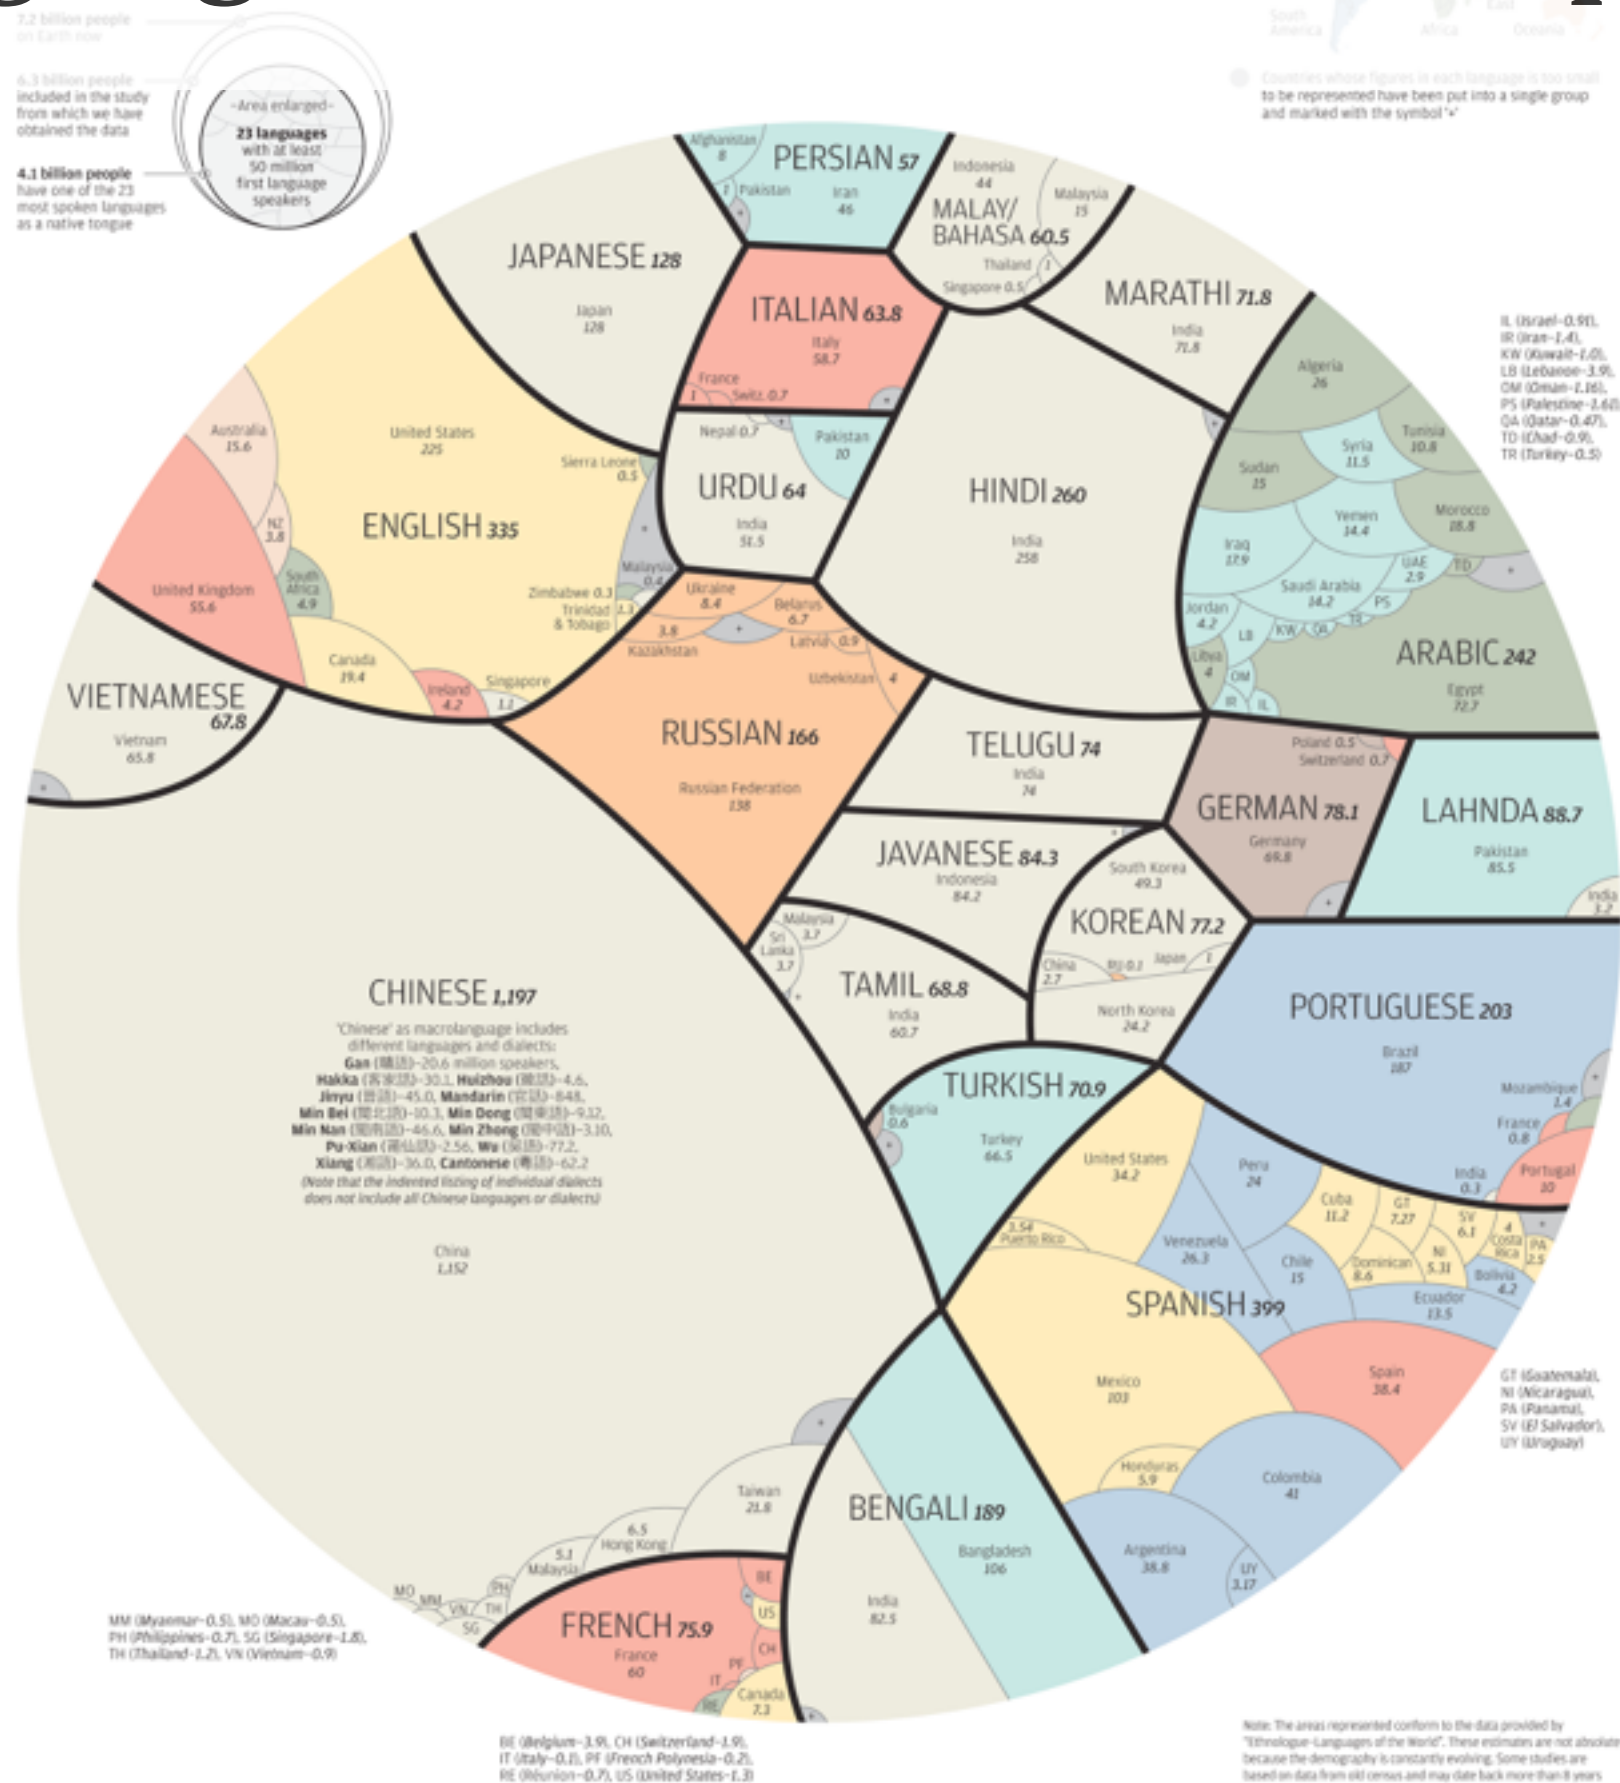

<http://www.ethnologue.com/world>

Language populations are Zipfian

According to www.ethnologue.com/statistics/size, only **5.6%** of languages have $\geq 1\text{M}$ native speakers—but these account for **94%** of the world's population.

23 languages with $\geq 50\text{M}$ native speakers

Areas of study

Structure / Grammar		Language in the world	Methods/ Applications
Form	Function

Syntax

Morphology: how **words** are formed

A **morpheme** is a minimal unit of meaning:
in- (prefix), *advise* (stem), *-able* (suffix)

Some morphemes combine in predictable (rule-governed) patterns. Such a pattern is said to be **productive** if it can give rise to new words. Other patterns only apply to specific words, e.g., *man* (sg)/*men* (pl).

Morphology: how **words** are formed

English is **morphologically impoverished** compared to most languages (except Chinese, which has even less morphology).

German has some famously long **compounds**:
rindfleischetikettierungsüberwachungsaufgabenübertragungs-
gesetz

‘the law for the delegation of monitoring beef labeling’

In Turkish, an **agglutinative** language, a “word”
can be an entire sentence:

İstanbul-lu-laş-tır-a-ma-yabil-ecek-ler-imiz-den-miş-siniz
‘You were (evidentially) one of those who we may not be able
to convert to an Istanbulite’

Syntax

Syntax: how **sentences** are formed from words

Linguistic categories help us to describe syntactic patterns.

Part of speech (POS): the grammatical category of a word

noun, pronoun, verb, adjective, adverb, determiner, preposition, ...

Grammatical relation: how a word functions relative to other words in the sentence
subject, predicate, object, modifier, ...

Phrasal category:

noun phrase, prepositional phrase, clause

Syntax

Syntax vs. Morphology: a tradeoff

English is called an **analytic** language because it mainly relies on word order/syntax to indicate sentence structure:

The cat ate the fish ≠ The fish ate the cat

Synthetic languages make heavier use of morphology to indicate how words function in a sentence.

synthetic

analytic

Morphology

Syntax

Syntax vs. Morphology: a tradeoff

A **case marker** signals whether a verb's argument is the subject, object, etc.

Remnants of case in English pronouns:
She loves him / He loves her

English is strict about word order (*Him loves she),
but synthetic languages with case are more
flexible.

Language Spotlight

Lighting Presentations

- As a practical measure, most of the lectures will focus on English. But other languages raise other challenges for NLP/language technologies.
- From now on, we'll start class with a 5-minute presentation from one of you that describes a different language. This will showcase the diversity of the world's languages.

Language Spotlight

Lighting Presentations

- Ground rules:
 - 1 presentation per enrolled student. Sign up for a slot after class today.
 - You must choose a language/dialect that (a) is not American English and (b) has not been presented yet.
 - Email the Instructor & TA at least a week in advance to confirm your choice of language.
 - The style of presentation is up to you: you may use slides, handouts, multimedia, etc.
 - 5 minutes. PRACTICE WITH A TIMER. We WILL cut you off if you go over.

Language Spotlight

Lighting Presentations

- Your presentation should cover:
 1. **Typological overview:** how many speakers, where spoken, what language family/related languages; synthetic vs. analytic, SVO/VSO/etc., what kinds of inflectional morphology on nouns and verbs, what kinds of agreement
 - * <http://ethnologue.org/>, <http://wals.info/>
 2. A couple of **interesting phenomena** in the language (probably: different from English). Give examples (with IPA or romanized transliteration if a non-roman script). E.g., German compounds.
 3. What about this language would be especially **difficult** for NLP/language technologies?
