# **Neural** sequence modeling

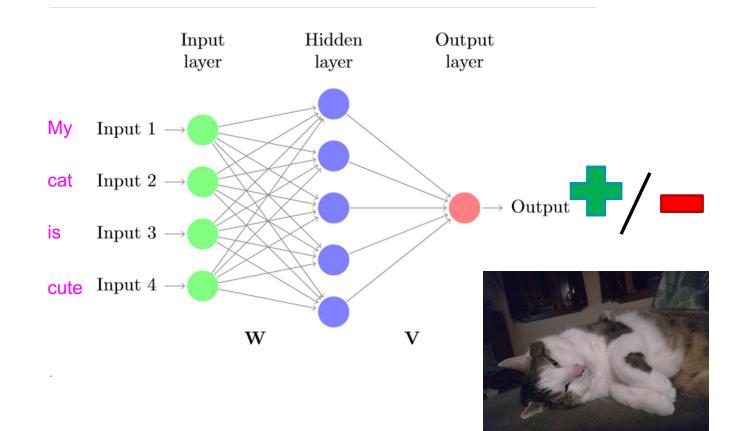

#### Jakob Prange (with some updates by Michael Kranzlein)

Graphics and inspirations by Taylor Arnold, Fei-Fei Li, Justin Johnson, Serena Yeung, Dan Jurafsky, James Martin, Austin Blodgett

## **Review: Neural networks**

- Simplest architecture: Feed-forward
- "Multilayer Perceptron"
- "Depth" = how many hidden layers
- One-to-one

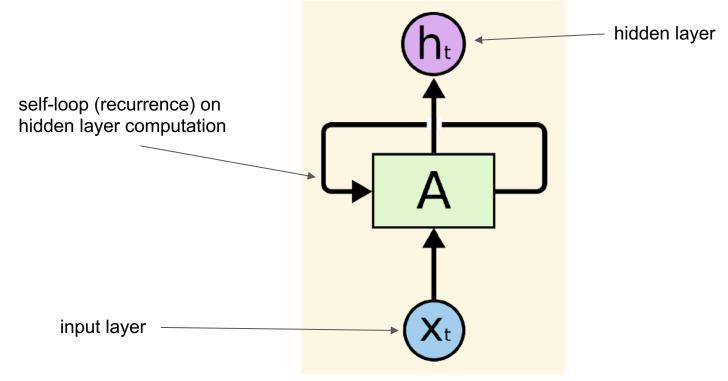

#### Neural networks and text

- Number of nodes per layer is fixed
  - Number of inputs is fixed
- Length of a sentence, word, sound signal, ...

#### • Not fixed!

- <u>Idea</u>: Think of language data as streaming in over time.
  - For each new input, we update our prediction.

#### Today: Recurrent neural networks (RNNs)

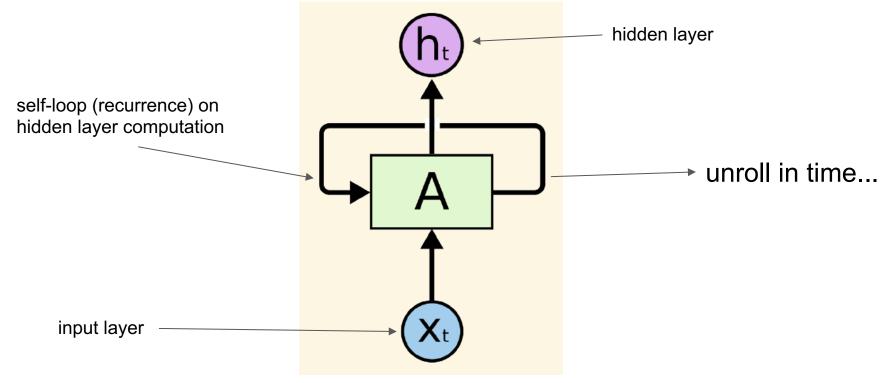

# Agenda for today

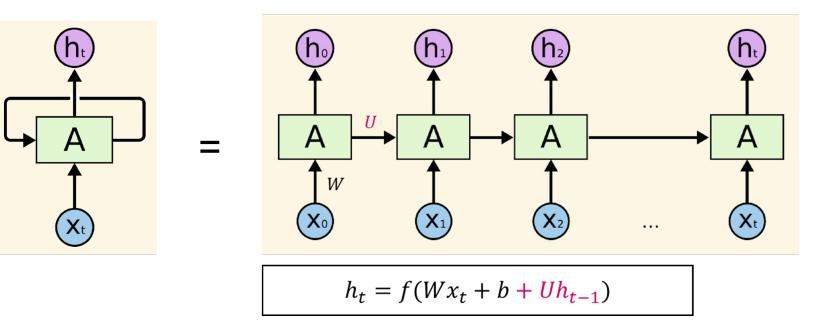

- What is an RNN?
- What can it be used for?
- How is it trained? (some math, but not too much)
  - The problem of vanishing and exploding gradients
- The LSTM model and some variants
- Interpretability

# What is an RNN?

Arnold

#### What is an RNN?

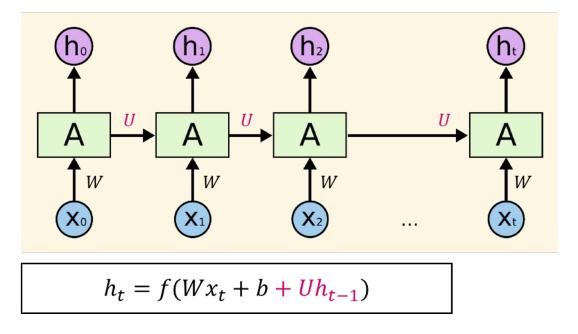

# What is an RNN?

#### Some notes

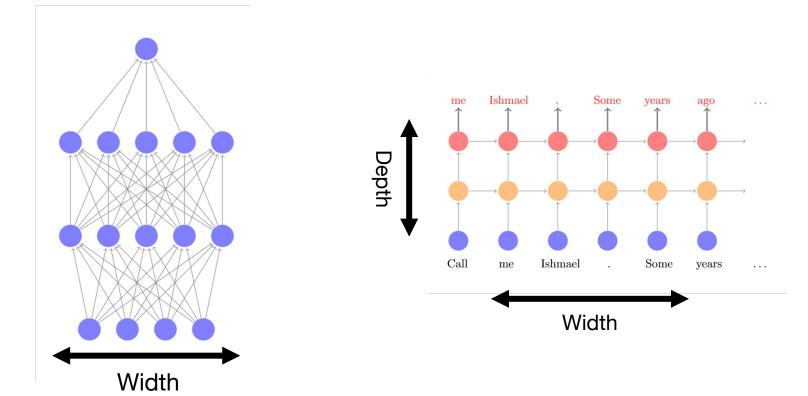

- Weights are shared between each time step
- We initialize a new RNN for each sequence!
- "Deep" in the length of the sequence

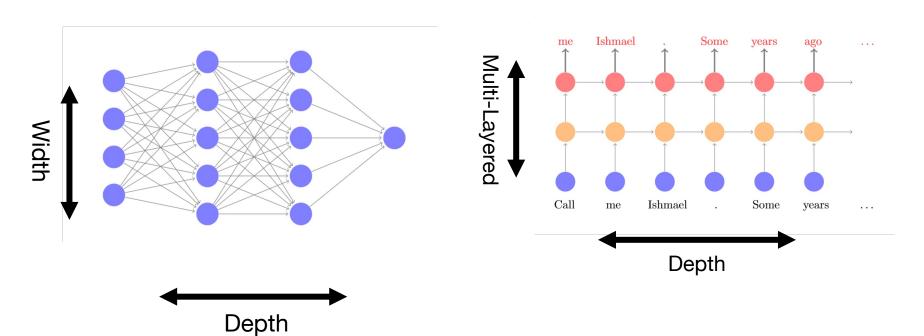

#### **RNNs as Deep Networks**

Depth

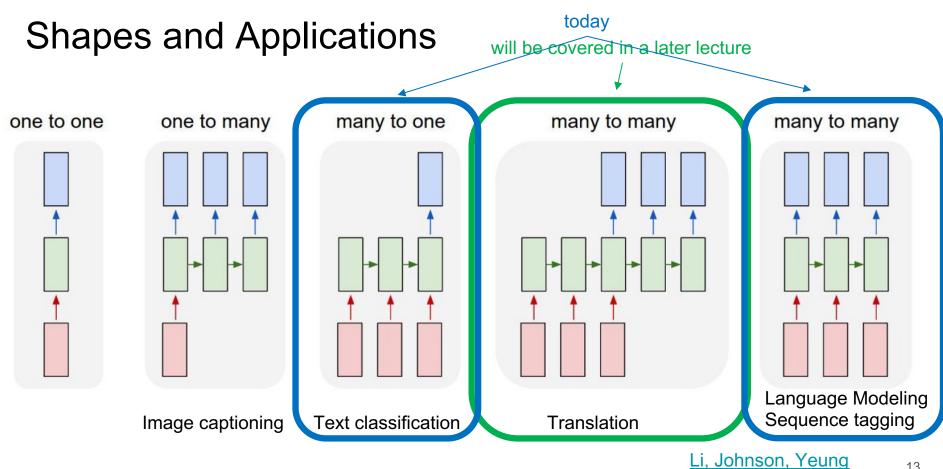

#### **RNNs as Deep Networks**

#### RNNs as input to other NNs

- Usually, we feed the hidden representation produced by an RNN into another layer or multi-layered network to produce a prediction, which can be...
  - <u>per-token</u> (tagging) or for the whole <u>sequence</u> (classification)
  - non-probabilistic or probabilistic (using softmax)

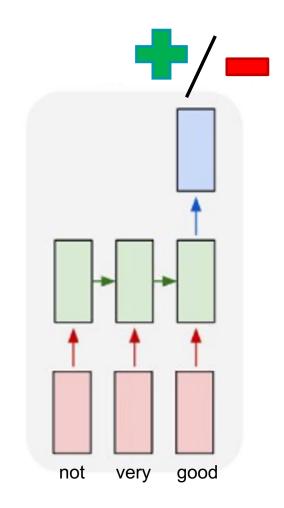

• Or we are interested in learning embeddings of the input itself

## **Text classification**

- Let RNN read and process input text
- Use hidden representation of last input token to make prediction for the whole sequence

• Example: sentiment analysis

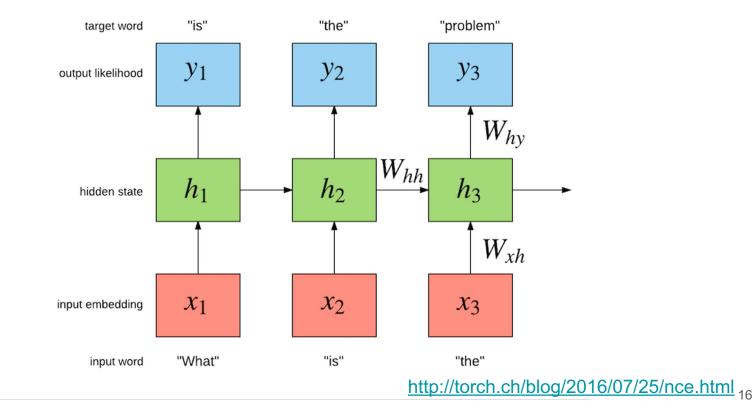

#### Language modeling

- Recall generative (**n-gram**) language models
  - Given the previous context, predict next word

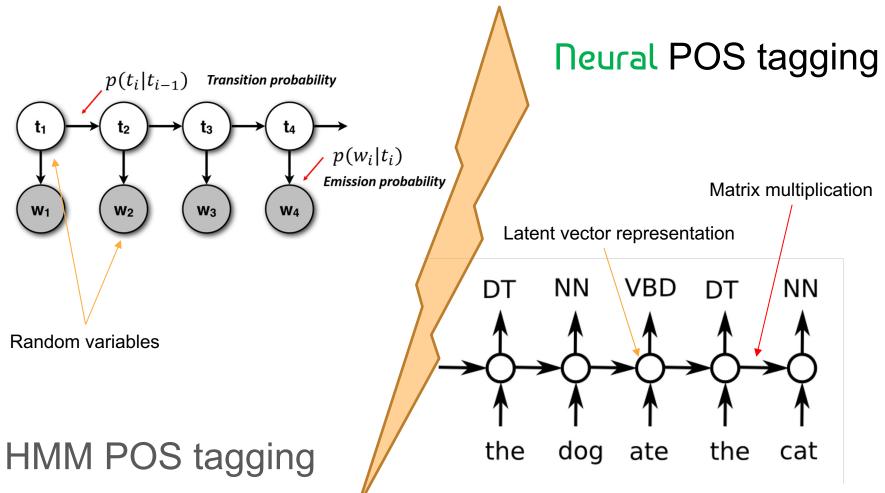

• How can we implement this as an RNN?

#### Recurrent **Neural** language modeling

# POS tagging

- Recall generative (HMM) POS tagging
  - Given previous POS tag, predict tag that is most likely to generate current word
  - Find optimal sequence (Viterbi)
- By default, RNNs (as neural networks in general) are discriminative, not generative!
  - Can model output directly at each timestep

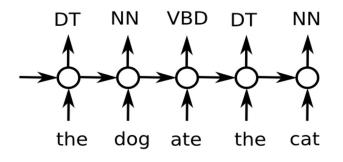

## Issues with the vanilla RNN

Despite having no explicit independence assumptions, distant cells are unlikely to influence each other.

Why?

- 1. At **prediction** time because new inputs "overwrite" old memory
- 2. At training time because of how backpropagation works

#### Training a Deep Neural Network

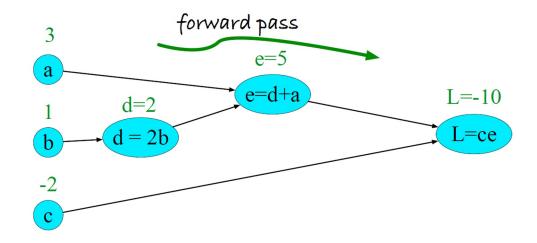

- High-level: Tuning of hyperparameters and architecture
  - Dimensionality of hidden layers
  - Dropout rate
  - Learning rate
  - Batch size
  - "Resolution" of input:

sentences, words, characters, ...

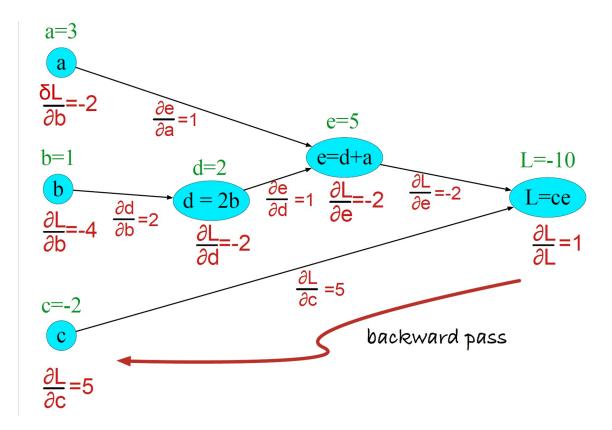

- Low-level: Backpropagation
  - Error-driven (minimizing loss function)
  - Lots of matrix multiplications
  - Made possible through modern computing power, especially GPUs

(and more recently, TPUs)

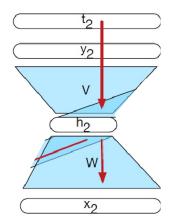

#### Training a Deep Neural Network

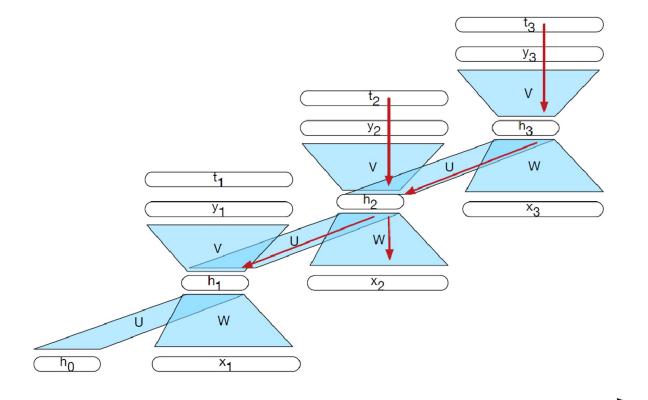

#### **Training a Deep Neural Network**

#### Gradient flow in a FFNN

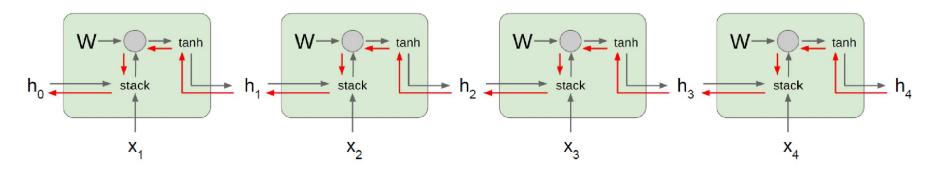

#### Gradient flow in an RNN

Jurafsky & Martin 24

#### Gradient flow in an RNN

Computing gradient of h0 involves many factors of W. If gradients in deeper layers are > 1, they will get exponentially bigger.

If gradients in deeper layers are < 1, they will get exponentially smaller.

"Exploding gradients"

"Vanishing gradients"

Li, Johnson, Yeung

RNNs can be used to \_\_\_\_\_\_ sequences

of arbitrary length, thanks to a self-loop on the hidden layer

 RNNs can be used to <u>classify</u> sequences of arbitrary length, thanks to a self-loop on the hidden layer

RNNs can be used to classify, generate sequences of arbitrary length, thanks to a self-loop on the hidden layer 2 for the price of 1

• RNNs can be used to <u>classify, generate, learn representations of</u> sequences of arbitrary length, thanks to a self-loop on the hidden layer

- RNNs can be used to <u>classify, generate, learn representations of</u> sequences of arbitrary length, thanks to a self-loop on the hidden layer
- Shared weights between time steps
- New initialization per sequence
- Can be "unrolled" and viewed as deep FFNN

• **Problem:** Vanishing and exploding gradients

## Quick Break! – Something to think about:

1. How are representations we get from RNNs different from EMBEDDINGS?

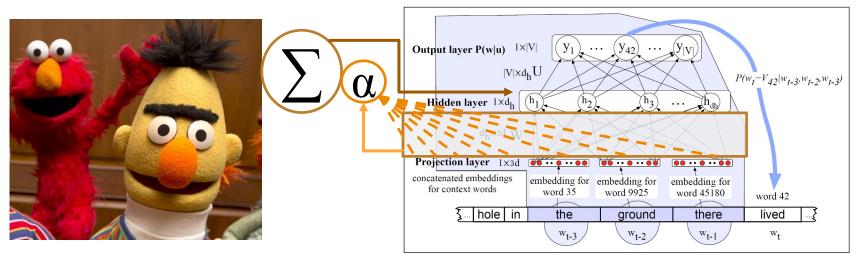

2. Could we get a similar effect WITHOUT the recurrence?

Contextualized

Global

## Non-Recurrent Neural LM

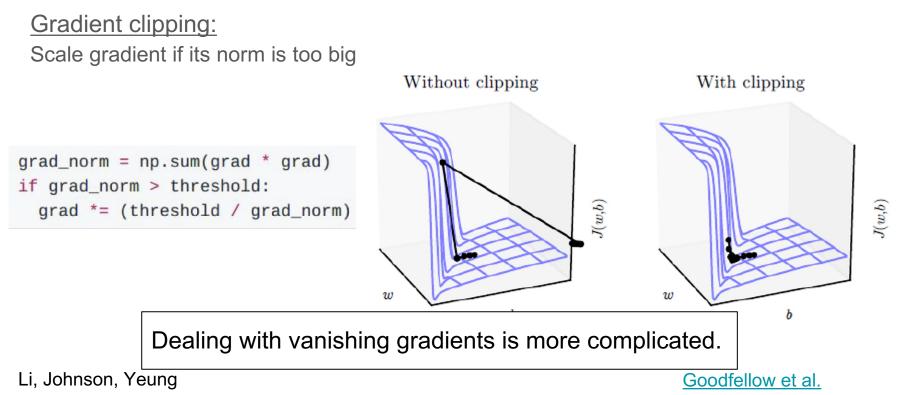

- Non-neural approach: n-grams p(w<sub>t</sub> | w<sub>t-1</sub>, w<sub>t-2</sub>, w<sub>t-3</sub>)
- Neural approaches:
  - Convolutional neural net (CNN) with kernel size = n
  - Transformers: "Attention is all you need" (BERT and friends)

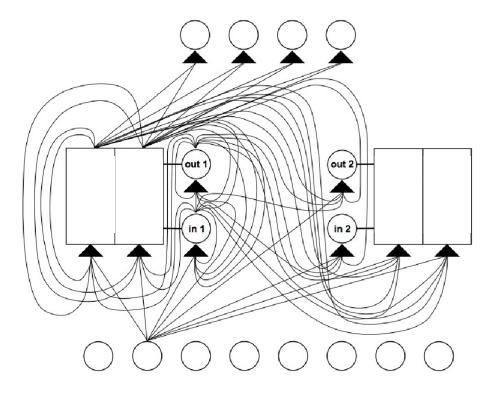

# Exploding and vanishing gradients

- Occur in FFNNs as well
  - Worse the more layers you have
- Bigger problem with RNNs because network is **deep in the length of the sequence** and **deep in the number of layers**

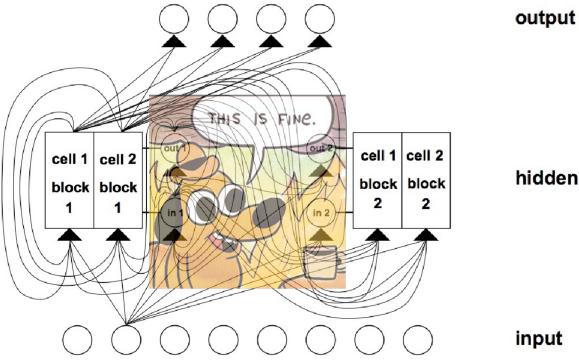

# Exploding and vanishing gradients

#### Ancient Treasure Map

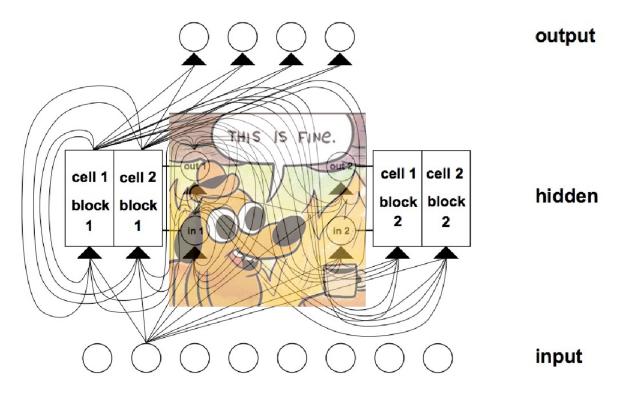

## Long Short-Term Memory (LSTM)

hidden

input

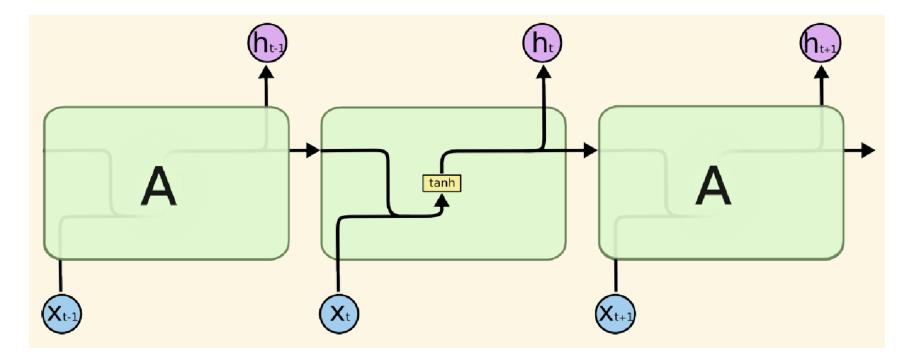

## Ancient (!) Long Short-Term Memory (LSTM)

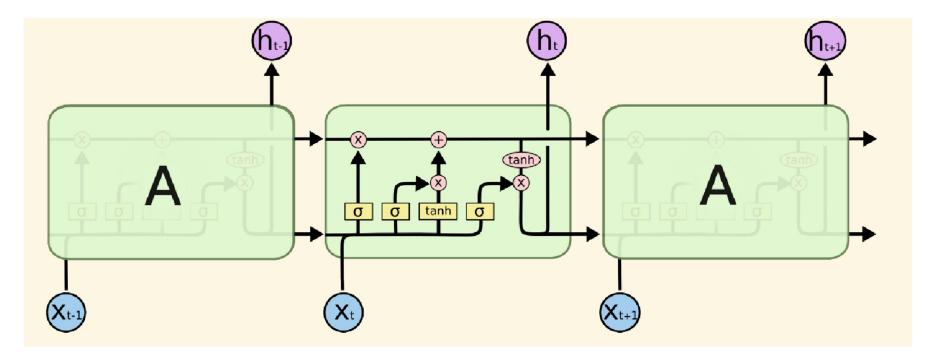

Hochreiter and Schmidhuber, **1997**, accessed through lecture slides by Arnold

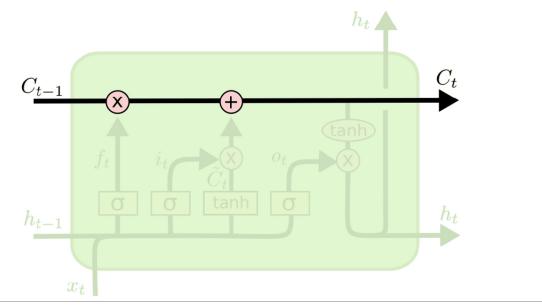

Fundamentally, an LSTM is just an RNN with some additional machinery within each node of the network.

- New concept of **cell state**
- 3 gates that are just functions of the cell state and hidden state:
  - Forget
  - o Input
  - Output

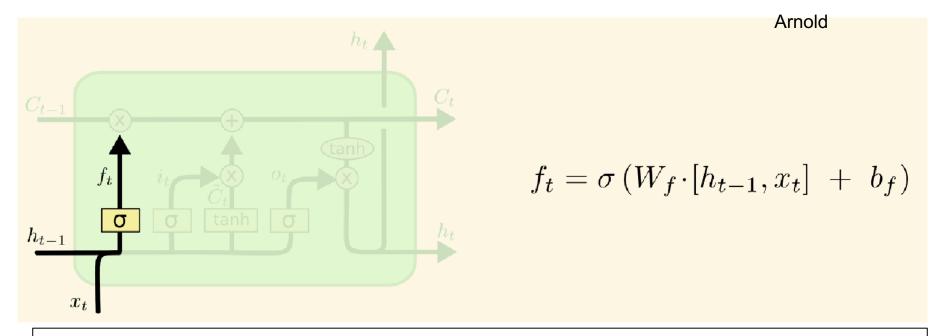

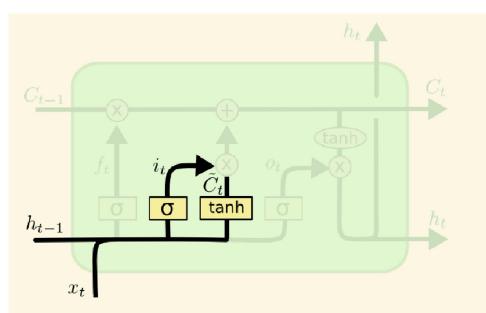

**Cell state / context memory** is separated from cell output, and is only changed by two linear functions at each time step.

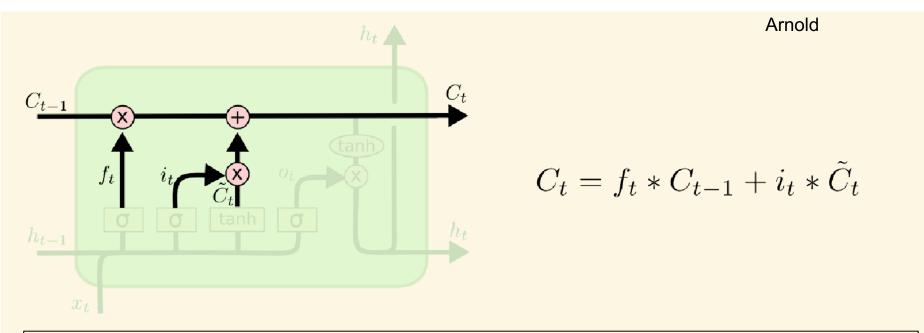

Forget gate determines if previous context should be taken into account.

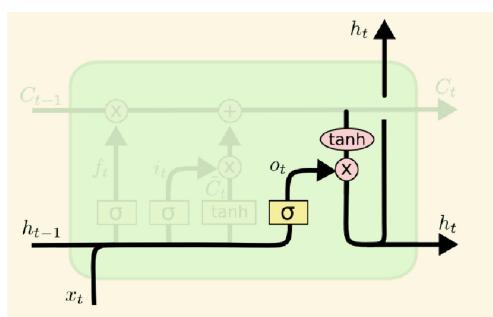

$$i_t = \sigma \left( W_i \cdot [h_{t-1}, x_t] + b_i \right)$$
$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

**Input gate** determines if and how much of the current input should be taken into account.

**Cell state / context memory** is now completely determined and can be calculated directly.

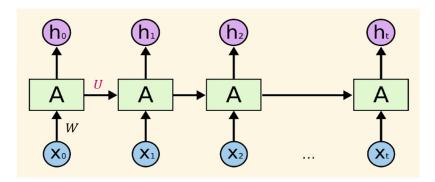

Arnold  $o_t = \sigma \left( W_o \left[ h_{t-1}, x_t \right] + b_o \right)$   $h_t = o_t * \tanh \left( C_t \right)$ 

**Output gate** determines if and how much of the cell state should be yielded as output.

Instead of weights **W** and **U** in an RNN, we have:

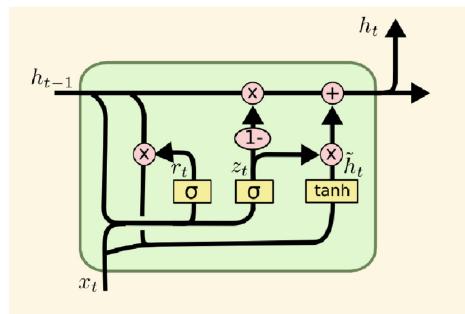

- W<sub>f</sub>
- W<sub>i</sub>
- W<sub>o</sub>

- Separates cell state and output
- Vanishing gradient only occurs if all partial derivatives tend toward 0
  - Gradient of cell state is conveniently *additive* instead of *multiplicative*, reducing likelihood of all sub gradients being 0
- 3 gates:
  - Forget
  - Input
  - Output
- Infinite memory is regulated via these gates to better capture long-range dependencies

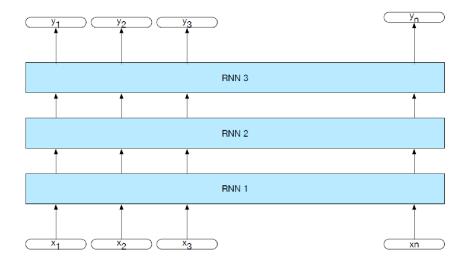

## Gated Recurrent Unit (GRU)

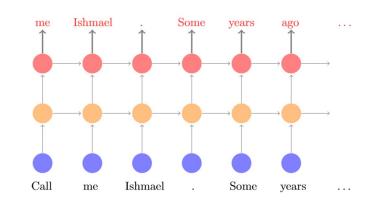

- Simpler: combines forget and input gates
- Equally powerful: gates still take care of vanishing/exploding gradients

$$z_t = \sigma \left( W_z \cdot [h_{t-1}, x_t] \right)$$
$$r_t = \sigma \left( W_r \cdot [h_{t-1}, x_t] \right)$$
$$\tilde{h}_t = \tanh \left( W \cdot [r_t * h_{t-1}, x_t] \right)$$
$$h_t = (1 - z_t) * h_{t-1} + z_t * \tilde{h}_t$$

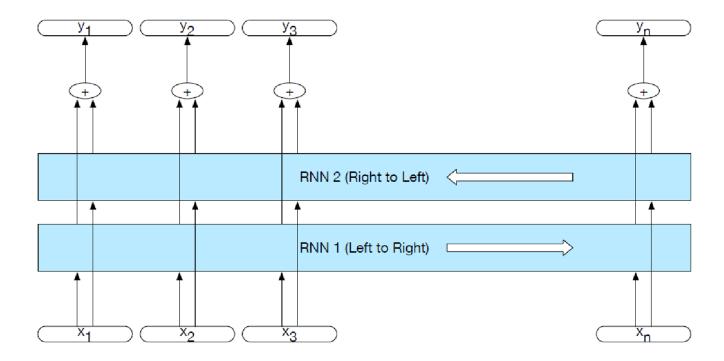

## Stacked RNN

"Why do what that day," replied Natasha, and wishing to himself the fact the princess, Princess Mary was easier, fed in had oftened him. Pierre aking his soul came to the packs and drove up his father-in-law women.

### **RNNs** are powerful!

#### **PANDARUS**:

Alas, I think he shall be come approached and the day When little srain would be attain'd into being never fed, And who is but a chain and subjects of his death, I should not sleep.

#### Second Senator:

They are away this miseries, produced upon my soul, Breaking and strongly should be buried, when I perish The earth and thoughts of many states.

#### DUKE VINCENTIO:

Well, your wit is in the care of side and that.

#### Second Lord:

They would be ruled after this chamber, and my fair nues begun out of the fact, to be conveyed, Whose noble souls I'll have the heart of the wars.

#### Clown:

Come, sir, I will make did behold your worship.

#### VIOLA: I'll drink it.

#### VIOLA:

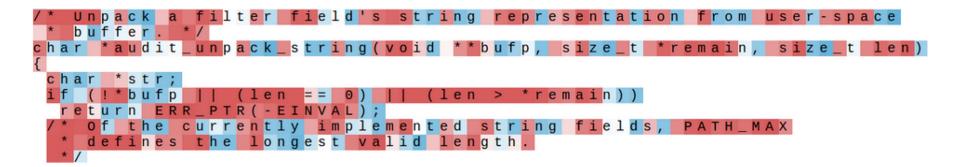

Why, Salisbury must find his flesh and thought That which I am not aps, not a man and in fire, To show the reining of the raven and the wars To grace my hand reproach within, and not a fair are hand, That Caesar and my goodly father's world; When I was heaven of presence and our fleets, We spare with hours, but cut thy council I am great, Murdered and by thy master's ready there My power to give thee but so much as hell: Some service in the noble bondman here, Would show him to her wine.

#### KING LEAR:

0, if you were a feeble sight, the courtesy of your law, Your sight and several breath, will wear the gods With his heads, and my hands are wonder'd at the deeds, So drop upon your lordship's head, and your opinion Shall be against your honour.

## RNNs are powerful!

Proof. Omitted. This since  $\mathcal{F} \in \mathcal{F}$  and  $x \in \mathcal{G}$  the diagram Lemma 0.1. Let C be a set of the construction. Let C be a gerber covering. Let F be a guasi-coherent sheaves of O-modules. We have to show that  $\mathcal{O}_{\mathcal{O}_{X}} = \mathcal{O}_{X}(\mathcal{L})$ gor. *Proof.* This is an algebraic space with the composition of sheaves  $\mathcal{F}$  on  $X_{\acute{e}tale}$  we have  $\mathcal{O}_X(\mathcal{F}) = \{morph_1 \times_{\mathcal{O}_Y} (\mathcal{G}, \mathcal{F})\}$ where  $\mathcal{G}$  defines an isomorphism  $\mathcal{F} \to \mathcal{F}$  of  $\mathcal{O}$ -modules. X **Lemma 0.2.** This is an integer Z is injective.  $\operatorname{Spec}(K_{*})$ Morsets d(Oxxa, G) Proof. See Spaces, Lemma ??. is a limit. Then  $\mathcal{G}$  is a finite type and assume S is a flat and  $\mathcal{F}$  and  $\mathcal{G}$  is a finite **Lemma 0.3.** Let S be a scheme. Let X be a scheme and X is an affine open type  $f_{\bullet}$ . This is of finite type diagrams, and covering. Let  $\mathcal{U} \subset \mathcal{X}$  be a canonical and locally of finite type. Let X be a scheme. the composition of G is a regular sequence. Let X be a scheme which is equal to the formal complex. O<sub>X'</sub> is a sheaf of rings. The following to the construction of the lemma follows. *Proof.* We have see that  $X = \operatorname{Spec}(R)$  and  $\mathcal{F}$  is a finite type representable by Let X be a scheme. Let X be a scheme covering. Let algebraic space. The property  $\mathcal{F}$  is a finite morphism of algebraic stacks. Then the cohomology of X is an open neighbourhood of U.  $b: X \to Y' \to Y \to Y \to Y' \times_Y Y \to X.$ *Proof.* This is clear that  $\mathcal{G}$  is a finite presentation, see Lemmas ??. A reduced above we conclude that U is an open covering of C. The functor  $\mathcal{F}$  is a be a morphism of algebraic spaces over S and Y. "field  $\mathcal{O}_{X,x} \longrightarrow \mathcal{F}_{\overline{z}} \rightarrow \mathcal{I}(\mathcal{O}_{X_{dtale}}) \longrightarrow \mathcal{O}_{X_{d}}^{-1}\mathcal{O}_{X_{\lambda}}(\mathcal{O}_{X_{z}}^{\overline{v}})$ *Proof.* Let X be a nonzero scheme of X. Let X be an algebraic space. Let  $\mathcal{F}$  be a is an isomorphism of covering of  $\mathcal{O}_X$ . If  $\mathcal{F}$  is the unique element of  $\mathcal{F}$  such that Xquasi-coherent sheaf of  $\mathcal{O}_X$ -modules. The following are equivalent is an isomorphism. (1)  $\mathcal{F}$  is an algebraic space over S. The property  $\mathcal{F}$  is a disjoint union of Proposition ?? and we can filtered set of (2) If X is an affine open covering. presentations of a scheme  $\mathcal{O}_X$ -algebra with  $\mathcal{F}$  are opens of finite type over S. If  $\mathcal{F}$  is a scheme theoretic image points. Consider a common structure on X and X the functor  $\mathcal{O}_X(U)$  which is locally of If  $\mathcal{F}$  is a finite direct sum  $\mathcal{O}_X$ , is a closed immersion, see Lemma ??. This is a finite type. sequence of  $\mathcal{F}$  is a similar morphism

Pick a neuron in the hidden representation and trace when it "fires".

Kutuzov, shrugging his shoulders, replied with his subtle penetrating smile: "I meant merely to say what I said."

Quote detection cell

The sole importance of the crossing of the Berezina lies in the fact that it plainly and indubitably proved the fallacy of all the plans for cutting off the enemy's retreat and the soundness of the only possible line of action--the one Kutuzov and the general mass of the army demanded--namely, simply to follow the enemy up. The French crowd fled at a continually increasing speed and all its energy was directed to reaching its goal. It fled like a wounded animal and it was impossible to block its path. This was shown not so much by the arrangements it made for crossing as by what took place at the bridges. When the bridges broke down, unarmed soldiers, people from Moscow and women with children who were with the French transport, all--carried on by vis inertiae-surrender.

Line length tracking cell

- **Probing** tasks to discern whether these models implicitly learn different aspects of syntax, semantics
- E.g., Linzen et al. (2018), Linzen et al. (2016), Ettinger et al. (2016), Ettinger and Linzen (2016)

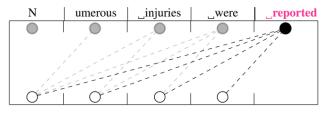

• Enjoy with caution!

## Summary

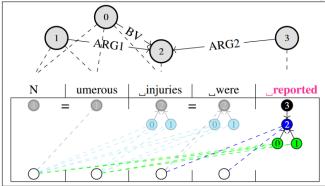

- Feed-forward NNs are very powerful, but not well-suited for language data
- Recurrent NNs model variable-width data as **streaming in over time**
- Many different applications in NLP (and elsewhere, e.g., Bioinformatics)
- LSTMs and GRUs:
  - Address the problem of exploding and vanishing gradients
  - Better at capturing long-range dependencies
- These days more and more replaced by Transformers
- Drawbacks (of all sequential NNs):
  - More parameters to train
  - Usually require large amounts of training data
  - Tricky to interpret what exactly is learned

## Linguistic Structure beyond the Sequence

GPT-2: Neural language model with multihead attention

EDS: Semantic predication/modification and variable binding

[Prange, Schneider, Kong: Ongoing Work.]

- Scaffolding sequential NNs with linguistically-motivated hierarchical structure
- → Improve LM quality!

- Better explainability (?)
- Less training data required (?)
- Fewer parameters (?)
