Office hours: 12:30-1:30 Tue/Thu, and by appointment

Class Meetings

Tue/Thu 11:00-12:15, ICC 119

Course Description

The course begins with a brief introduction to electronics, transistor-level circuit breadboarding, and a historical overview of computing. We then develop some theoretical ground work (Finite State Automata and Turing Machines). We look at general processor concepts (the von Neumann and Harvard models), data representations and operations (including integer, character, image, sound, and floating-point), basic Shannon theory (rates, errors, and encoding), and memory functions. We also cover Boolean Algebra, logic implementations from mechanical switches to Very Large Scale Integration (VLSI), and basic digital logic design. We then concentrate on single-threaded processor architecture and computer system organization from a programmer's perspective using assembly language and C. In parallel with the above is a processor design project which implements a micro-architecture for a simplified MIPS-like ISA. The hierarchical implementation combines circuit design coupled with sub-modules implemented in Verilog, a hardware description language. Circuits are implemented using Electric (an Electronic Design Automation tool),which are compiled to a complete Verilog description and then simulated. A simple one-pass assembler is implemented, and assembly language programs are written, assembled, and hand linked, then executed by simulation for testing. Students manage their design source documents using Subversion, a source-code version-control system. The workload includes weekly assignments, a mid-term exam, a comprehensive final exam, and two projects (the CPU implementation and a breadboard implementation of a small finite-state machine using TTL devices). Prerequisites: COSC 052 (CS-2) and 030 (Math for CS).

Course Goals

Our goal is to develop foundational concepts, principles, and analytic skills which can be generally applied in any computational setting. We want the ability to intelligently approach any computational system or question from the perspectives of cost, practicality, computational power, future technological prospects, or theoretical interest; and the ability to educate ourselves when needed in the general area of computing systems. We want to have background knowledge of the concrete and detailed specifics of some example computing hardware that is generally representative. We want to acquire a level of skill in applying general principles to actual systems, recognizing technological tradeoffs involved, evaluating differing organizational implementations, and recognizing how instruction types and their execution requirements interact with the low-level hardware-software systems interface and thereby affect a system's applicability and performance. We want to understand how theoretical and implementation aspects of a system provide capabilities while simultaneously

imposing limitations both on what we can do and how best to go about it. Finally, we want to develop our abstract and hierarchical systems thinking, our ability to think conceptually about parallel execution and programming, and acquaintance with tools and methods for system design, simulation, and verification.

Course Learning Objectives

To know
the basic difference between digital and analog computing;
the essential concepts of an effective procedure;
how to hierarchically compose functional elements;
what Turing universality has to do with programming language computational expressiveness;
the difference between source code and machine code;
how to use the Subversion commandline for file sharing and revision control;
the difference between a Subversion working copy and a repository copy;
how to design simple circuits and hierarchical systems in the Electric EDA;
the connection between Electric designs and the resulting extracted verilog simulation code;
how to write and use simple verilog testbenches;
the structure of the von Neumann architecture and its principle components;
the phases of instruction execution and structure of instruction formats;
the nature of bits, bit order, bytes, byte order, words, and basic memory operations;
the meaning of machine state, state transition, and input/output for finite state machines;
Mealy and Moore machines, state elements, next-state and output functions;
the Turing model of computation, finiteness, symbols and symbols sets, state and symbol encodings;
the difference between data-path state elements and control state elements;
the connections between register states, variable states, and machine states;
the congruence between computers and universal Turing machines, machine encodings and programs;
the simulation function of a universal Turing machine and composition of Turing machines;
the Halting Problem and the nonexistence proof by diagonalization and contradiction;
how to convert a verbal description of a system into a state-transition diagram description;
how to convert between a state-transition diagram and a Turing simulator's unary encoding;
how to convert a verbal description of a simple computational task to a Turing machine description;
the basic Boolean functions, composition, algebraic properties, min/max terms and expansions;
conversion from Boolean truth-table to AND-OR or OR-AND or NAND-NAND circuits;
the design and function of latches, flip-flops, and their use as FSM state or datapath elements;
elementary device physics and scaling effects on speed, design, clocking, heat, and market forces;
busses, transistors, tri-state buffers, basic CMOS logic gates, memory organization and interfaces;
logic design of decoders, muxes, demuxes, signal gating, PLAs,
basis of information and encoding, Shannon information theory, and error detection/correction;
complete languages, integer signed/unsigned arithmetic, 2's complement, floating point arithmetic;
CPU datapath, ISA, components, control states and signals, memory-i/o busses and devices;
CPU instruction execution, machine code, assembly programming, linking and assembly, debuggers;
RTL description, addressing modes and evaluation, memory delay, memory mapped i/o;
CPU traps/exceptions/interrupts, stack operations, interrupt priority, privilege, device polling;
basic use of unix shells, editors, regular expressions, and tools: sed, m4, tar, zip, make.

Required Text

Introduction to Computing Systems 2ed. Patt and Patel (McGraw-Hill, 2004, second printing)

Suggested Text

Computer Organization, Revised 4ed. Patterson & Hennessy (Morgan-Kaufmann, 2014)

The course roughly covers the Patt & Patel (PP) text through Chapter 10. Note that the Patterson & Hennessy (PH) text is used in the next course in the sequence, COSC-121. It may be possible for you to use only the PH text, but be warned that there are details in PP that are not in PH.

Topic	**Patt & Patel**	**Patterson & Hennessey**
Introduction	Chp. 1	Preface; Chp. 1
Boolean Logic	Chp. 3	Appendix C
Logic Design	Chp. 3	Appendix C
Sequential Circuits	Chp. 3	Appendix C
Instruction Set	Chp. 5	Chp. 2,
Datapath	Chp. 4, 5	Chp. 4
Control	Chp. 4, Appendix C	Chp. 4, Appendix D
ALU, arithmetic, numbers	Chp. 2, 3	Chp. 3
Bit-level ISA	Chp. 6	Chp. 2
ISA and Compilers	Appendix A	Chp. 2, Appendix B
Assembly	Chp. 7	Chp. 2, Appendix B
I/O Basics	Chp. 8	Chp. 6
Traps, call-return	Chp. 9	Chp. 2, Appendix B
Interrupt I/O	Chp. 10	Appendix B
Performance	---	Chp. 1

Academic Integrity Policy

In assigning grades, one of my jobs as instructor is to ascertain your growth in understanding the intellectual content of the course during our studies together. Course assignments and projects are intended to facilitate that growth. However, at times, one's thinking can get lead astray by side-issues that may seriously hamper your efforts to understand. It is very important that you do not dwell fruitlessly on some point that has you stuck. You should seek help as soon as practical, and your classmates can be an efficient resource. For that reason, I encourage you to freely exchange information, and this Academic Integrity Policy is designed to allow for, and encourage that kind of cooperation. The default policy for the Computer Science Department is amended as follows. You are free to discuss problems and solutions of any assignment or project with your classmates or others. You need not cite these conversations nor indicate which parts of your submitted material was garnered

from such conversations. You are free to collect information from any source, electronic or otherwise, and you need not indicate the original source nor that the material did not originate with you. In addition, in this context, I consider it a fault to withhold useful information from others; although, this policy makes no stricture against it. The ability to work cooperatively together is a learned skill that will be important later in life.

Grading

My grading system does not depend on evaluating your progress based on material of unknown origin. Homework is graded, but used solely to provide feedback, not in determining grades (However, see class participation below.) I do use your submitted material as a guide in developing examinations, and I might ask that all your work be returned to me temporarily; so, keep ALL your work together as a portfolio. If you feel you are not being evaluated thoroughly enough, it is incumbent on you to bring this to my attention while there is still time to address your concerns before grades are submitted. You are welcome to discuss these issues with me at any time.

Midterm exam: 25%, Final Exam: 40%, Participation (in class discussions, and number and completeness of homework submissions) 10%, Project Inquiry: 25%. In addition, verifiable, documented, and significant extension of project work may receive up to a 100% boost in overall score. A project inquiry is either an individual oral question and answer session, or a written examination, or a class presentation of the project.

Homework markup system

A check mark means:
"I mostly agree with what you said", "I cannot find anything worth quibbling about", "Technically the answer is correct and I have no complaint."

A "-" means :
"I think you are about 1/2 right", "There is something missing here, but not entirely wrong", "You missed the point somewhat, but what you did say was not exactly incorrect."

An "X" means:
"You did not answer the question", "The answer was too skimpy", "You basically missed the point".

A "?" means:
"I do not understand what you said", "Are you sure this makes sense?", "I think a part of what you said might not actually be true", "I wonder, I am not sure I believe you, but maybe you are correct".

A "+ +" means:
"I like what I see", "You went beyond the call of duty", "Nice job".

Homework grading should be thought of as a discussion, rather than a score. We mark up your work and return it to you. You can, and should if you feel it worth it, return your work with comments. I might then follow up in class or with additional comments, or you might follow up in class. In this way, a discussion takes place.
